

ABSTRACT

[0025] A cup holder comprising: a body having a top and bottom edge, the body including a first end and a second opposing end, wherein the first end and second end are adapted to be coupled to one another. In one embodiment, the cup holder includes a lip along the top edge of the body and extending between the first end and the second end, the lip positioned a distance from the outer surface of the cup. In one embodiment, the cup holder includes having a plurality of cone-shaped concave grooves in an inner surface of the body, extending between the lip and the bottom edge and defining corresponding air passageways with the outer surface of the cup, wherein the air passageways are in communication with the lip. In one embodiment, the cup holder includes perforated lines in the body which allow removal of a portion of the body from the cup holder.
